

ResiliLytics Dashboard

Sourcing Intelligence for Resilient Supply Chains

Guide 1: Understanding the Resilience Score

A Structured Explanation of the ResiliLytics Composite Procurement Resilience Index

Minimal data. Maximum sourcing intelligence. Automated risk-to-action

Understanding the Resilience Score

How ResiliLytics Translates Supplier Data into Structural Resilience Intelligence

1. What Is the Resilience Score?

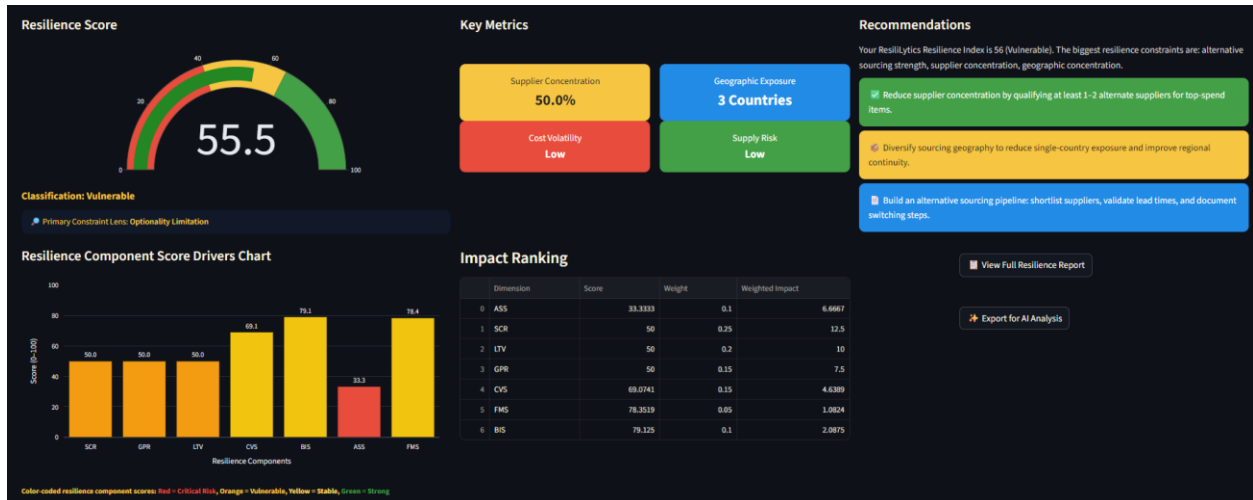

The ResiliLytics Procurement Resilience Score is a composite structural index (0–100) that evaluates the robustness of an SME's sourcing network against disruption, volatility, and concentration pressure.

- It is not a single KPI.
- It is not a volatility measure alone.
- It is not a supplier count metric.

It is a multidimensional structural resilience assessment built from seven calibrated dimensions.

The score reflects how structurally prepared your procurement network is to absorb disruption, volatility, and dependency pressure, applying SCOR-DS Source process principles to minimal supplier data."

2. Score Range & Classification

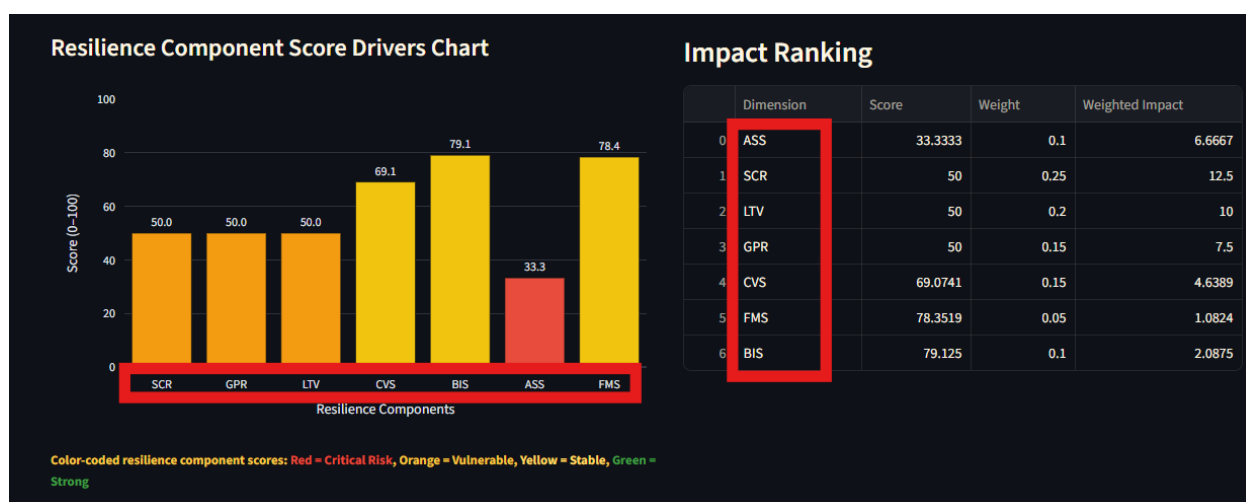

The Resilience score is classified into four structural categories:

Score Range	Classification	Structural Meaning
0–40	Critical Risk	Severe fragility; high disruption exposure
41–65	Vulnerable	Elevated structural concentration or instability
66–85	Stable	Generally balanced sourcing posture
86–100	Resilient	Strong diversification and absorption capacity

Classification is based on composite structure — not a single weak metric.

3. The Seven Resilience Dimensions

The composite score is derived from seven resilience dimensions:

3.1 SCR — Supplier Concentration Resilience

Measures dependency on the top supplier relative to total spend.

High concentration reduces structural continuity under disruption.

3.2 GPR — Geographic Portfolio Resilience

Measures exposure to single-country sourcing.

Single-country exposure increases sensitivity to regional disruption, logistics shocks, policy shifts, and currency risk.

3.3 LTV — Lead-Time Stability Proxy

An interaction-derived structural indicator reflecting timing instability risk under structural stress conditions.

Derived from the mathematical interaction of concentration and volatility signals within the uploaded dataset.

3.4 CVS — Cost Volatility Sensitivity

Derived from historical cost variability patterns.

Indicates exposure to budgeting instability and margin compression under cost fluctuation.

3.5 BIS — Buffer Inventory Readiness Proxy

An interaction-derived structural indicator of shock absorption capacity.

Represents how well your structural supply positioning can withstand volatility and concentration pressure simultaneously.

3.6 ASS — Alternative Sourcing Strength

Normalized measure of supplier optionality.

Higher supplier diversity improves switching speed during disruption.

3.7 FMS — Financial Margin Sensitivity Proxy

An interaction-derived structural indicator capturing structural pressure on profitability during disruption.

Derived from the concentration-weighted volatility interaction within the dataset.

4. How the Composite Score Is Calculated

The composite score is generated through a structured weighted framework calibrated for SME failure modes.

Each dimension contributes proportionally based on:

- Structural importance
- Empirical SME exposure patterns
- Interaction sensitivity

The weights are SME-calibrated and normalized.

The system also contains an adaptive concentration mode:

When top supplier dependency crosses structural thresholds, weighting emphasis dynamically adjusts toward concentration-sensitive dimensions.

This ensures the model reflects real-world fragility amplification rather than static arithmetic averaging.

5. What the Score Is (and Is Not)

The Score IS:

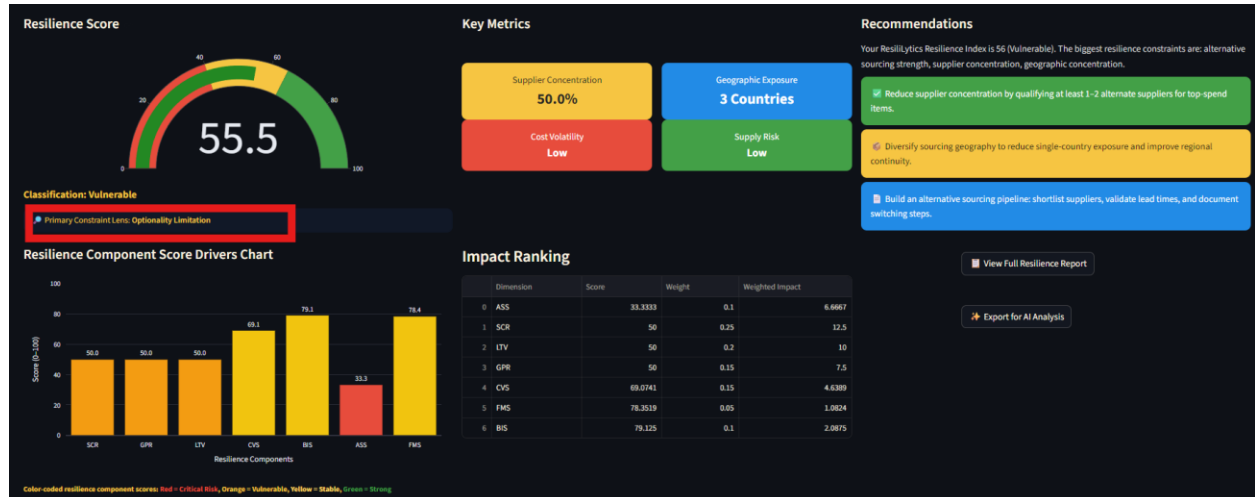

- ✓ A structural resilience assessment
- ✓ A multidimensional exposure model
- ✓ A decision-support instrument
- ✓ A risk-to-action prioritization tool

The Score Is NOT:

- ✗ A prediction of future disruption
- ✗ A guarantee of continuity
- ✗ A real-time operational dashboard
- ✗ A financial forecasting engine
- ✗ A claim of full SCOR-DS compliance — ResiliLytics applies SCOR-DS Source process principles within the sourcing domain

ResiliLytics evaluates structure — not events.

6. Primary Constraint Lens

Beyond the numeric score, the system identifies a **Primary Constraint Lens**.

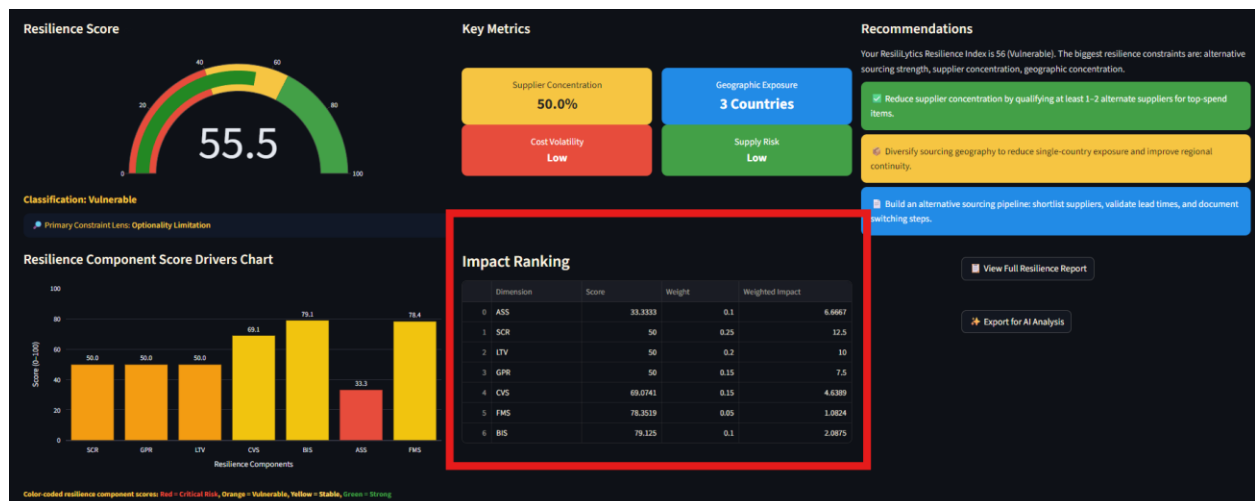

This represents the dominant systemic vulnerability cluster.

It classifies your structural risk posture into:

- Structural Fragility
- Operational Instability
- Financial/Volatility Exposure

This lens helps decision-makers focus where intervention leverage is highest.

7. Impact Ranking: Why Some Weaknesses Matter More

The Impact Ranking table calculates:

Weighted Impact = $(100 - \text{Score}) \times \text{Dimension Weight}$

This reveals which dimension is driving the composite score downward most materially.

Not all weaknesses are equally consequential.

The ranking prioritizes mitigation sequencing.

8. Why This Approach Is Different

Traditional dashboards:

- Display KPIs
- Show supplier counts
- Track spend variance

ResiliLytics:

- Derives structural inference from minimal input
- Integrates volatility $\times$ dependency interaction
- Applies adaptive weighting logic
- Translates structure into sequenced mitigation guidance

It is a resilience intelligence architecture — not a static dashboard.

9. Interpreting Your Score Strategically

A “Stable” score does not mean “safe.”

A “Resilient” score does not mean “invulnerable.”

The score answers one question:

How structurally prepared is your sourcing network to absorb disruption pressure?

Resilience is not the absence of risk.

It is the capacity to withstand it.

ResiliLytics applies SCOR-DS Source process principles — operationalizing agility, cost, and reliability performance attributes for SMEs who cannot access enterprise SCOR implementations. Available free at resililytics.com."
